

# 20CYS402 – Distributed Systems and Cloud Computing

---

## Lab Exercise – 7: Setting Up OpenStack Cloud Environment

**Name:** R Subramanian

**Roll Number:** CH.EN.U4CYS22043

---

## Objective

To install and configure **OpenStack** using Microstack to create a basic cloud environment. The lab involves:

1. Installing and initializing OpenStack.
  2. Creating a security group permitting **SSH** and **ICMP** traffic.
  3. Launching a virtual instance and verifying accessibility via **SSH** and **ping**.
- 

## Procedure / Steps

### Step 1: Install OpenStack using Microstack

```
sudo snap install microstack --beta --classic
```

---

### Step 2: Initialize Microstack

```
sudo /snap/bin/microstack init --control --auto
```

---

### Step 3: Set Keystone Admin Password

```
sudo /snap/bin/microstack.keystone-manage bootstrap \
--bootstrap-password admin \
--bootstrap-admin-url http://127.0.0.1:5000/v3/ \
--bootstrap-internal-url http://127.0.0.1:5000/v3/ \
--bootstrap-public-url http://127.0.0.1:5000/v3/ \
--bootstrap-region-id RegionOne
```

---

### Step 4: Create Security Group

- Created a security group named **allow-ssh-icmp**.
- Added rules for **SSH** (port 22) and **ICMP** (ping) traffic.

**Screenshot:**

## Create Security Group

**Name \***

**Description**

Allow SSH and ICMP

**Description:**

Security groups are sets of IP filter rules that are applied to network interfaces of a VM. After the security group is created, you can add rules to the security group.

**Create Security Group**

Project / Network / Security Groups / Manage Security Group Rule...

### Manage Security Group Rules: allow-ssh-ping (cf984f1f-1c9d-4f01-8de1-2808ca373b10)

[+ Add Rule](#) [Delete Rules](#)

Displaying 2 items	Direction	Ether Type	IP Protocol	Port Range	Remote IP Prefix	Remote Security Group	Description	Actions
	<input type="checkbox"/> Egress	IPv4	Any	Any	0.0.0.0/0	-	-	<a href="#">Delete Rule</a>
	<input type="checkbox"/> Egress	IPv6	Any	Any	::/0	-	-	<a href="#">Delete Rule</a>

## Step 5: Launch a VM Instance

- Selected Flavor: [m1.tiny](#)
- Selected Image: [cirros](#)
- Assigned Security Group: [allow-ssh-icmp](#)
- Launched the VM instance.

### Screenshot:

The screenshot shows two consecutive screenshots of the OpenStack Compute interface.

**Screenshot 1: Launch Instance Dialog**

This dialog is titled "Launch Instance". It has several tabs: "Details", "Source", "Flavor", "Networks", "Network Ports", and "Security Groups". The "Security Groups" tab is selected. Under "Allocated", it lists "default" (Default security group) and "allow-ssh-ping" (Allow SSH and ICMP). Under "Available", there is a search bar and a message "Select one or more". A note at the bottom says "No items to display". At the bottom right are "Cancel", "Back", "Next", and "Launch Instance" buttons.

**Screenshot 2: Instances List**

This screen shows the "Instances" list. The table header includes columns: Instance ID, Instance Name, Image Name, IP Address, Flavor, Key Pair, Status, Availability Zone, Task, Power State, Age, and Actions. One instance is listed: "test" (Image Name: Cirros2, IP Address: 192.168.222.75, 10.20.20.182, Flavor: m1.tiny, Status: Active, Availability Zone: nova, Power State: Running, Age: 5 minutes). Action buttons include "Create Snapshot" and "More Actions".

## Step 6: Assign Floating IP

- Assigned a **public floating IP** to the VM to allow external access via SSH and ICMP.

**Screenshot:**

## Step 7: Verify VM Access

- Ping Test:

```
ping <floating-ip>
```

- SSH Access:

```
ssh cirros@<floating-ip>
```

### Screenshot:

```

ping 10.20.20.182
PING 10.20.20.182 (10.20.20.182) 56(84) bytes of data.
64 bytes from 10.20.20.182: icmp_seq=1 ttl=63 time=2.62 ms

7 packets transmitted, 7 received, 0% packet loss, time 6045ms
rtt min/avg/max/mdev = 0.266/0.843/2.617/0.804 ms

```

## Conclusion

This lab demonstrated the setup of a **basic OpenStack cloud environment** using Microstack. Key learnings:

- Installing and initializing OpenStack services locally.
- Creating security groups for SSH and ICMP traffic.

- Launching and accessing virtual machine instances using floating IPs.
  - Understanding basic cloud operations, networking, and VM management.
-
